

Let us suppose that in walking towards Aidan, we have the ability to stop dead, and out of the infinite complexity of loopings in the surface of our own singularity, we are able to identify ourselves as one thing, one environment of under-standing ~ the threefold green-blue-red looping. If it is the case that every thing is a constituent of every other thing ~ environments of a singular surface, then we should, by reducing ourselves to the least possible configuration of a looping, be able to demonstrate what spacetime is, and how we com-prehend our ownmost objective existence on its basis. In other words, how does our understanding as a thing of singularity become our com-prehending of the different objects around us in reality?

Here represented is that green-blue-red threefold moment of the singularity of understanding. We call this momentary environment of under-standing, *moment of the* [green-blue-red] *thing*. A thing is the moment of understanding immediately prior to the first moment of an object in spacetime. Things are the precursors of objects, and their formation is random. Whether and how they become specific objects depends on other things looping randomly.

Although the figure below is exactly the same as the one above, it is called the *moment of realisation*. It is a [threefold] green-blue-red moment of understanding, under-standing its ownmost singularity, and be-coming self-aware [realising itself] ~ by *com-prehending* its ownmost difference from itself, tri-versely.
